- Php tutorial & manual: http://php.net/
  - http://php.net/manual/en/index.php

date.php

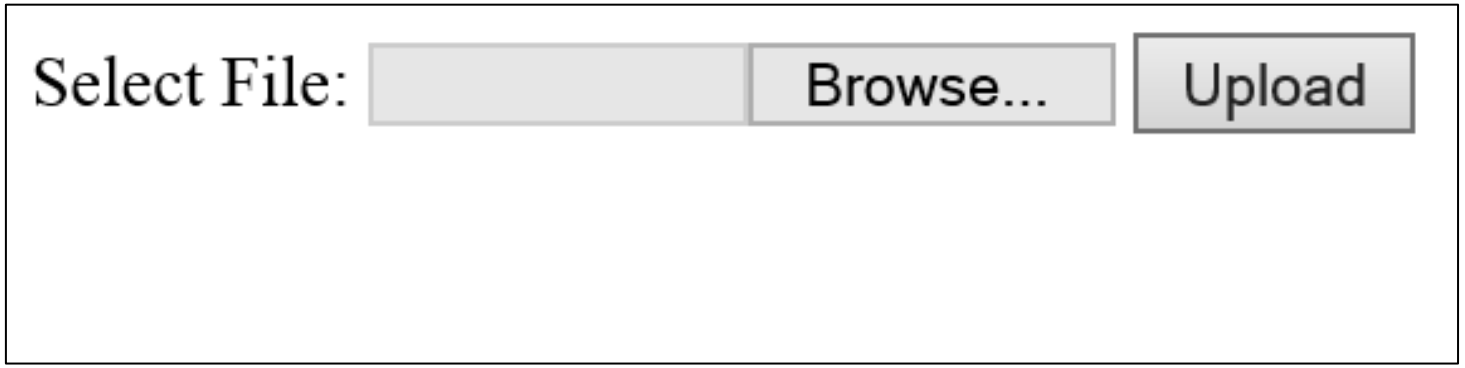

```
<html>
<head>
<title>My first page in PHP</title>
</head>
<body>

Current date. : <?php print (Date("l F d, Y")); ?>

</body>
</html>
```

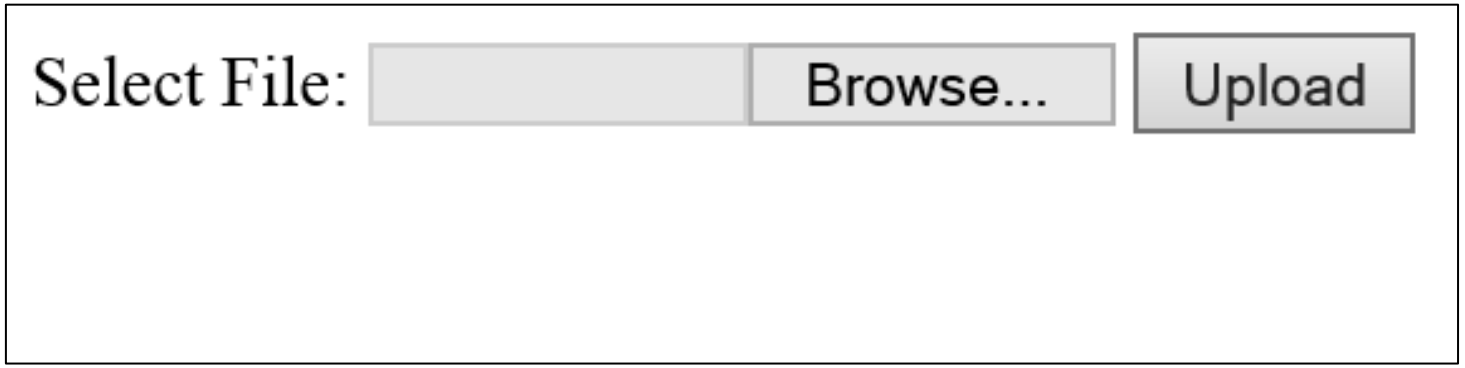

Upload.php

```
<?php
echo <<<_END
<html><head><title>PHP Form Upload</title></head><body>
<form method='post' action='upload.php' enctype='multipart/form-data'>
Select File: <input type='file' name='filename' size='10' />
<input type='submit' value='Upload' />
</form>
_END;

        // continue next slide
```

Upload.php

```
if ($_FILES)
{  $name = $_FILES['filename']['name'];
   move_uploaded_file($_FILES['filename']['tmp_name'], $name);
   echo "Uploaded image '$name'<br /><img src='$name' />";
}
echo "</body></html>";
?>
```

move_uploaded_file

http://php.net/manual/en/function.move-uploaded-file.php

move_uploaded_file

- (PHP 4 >= 4.0.3, PHP 5, PHP 7)

move_uploaded_file — Moves an uploaded file to a new location

Description

bool **move_uploaded_file** (string $filename , string $destination)

This function checks to ensure that the file designated by filename is a valid upload file (meaning that it was uploaded via PHP's HTTP POST upload mechanism).

If the file is valid, it will be moved to the filename given by destination.

move_uploaded_file

http://php.net/manual/en/function.move-uploaded-file.php

```
<?php
$uploads_dir = '/uploads';
foreach ($_FILES["pictures"]["error"] as $key => $error) {
    if ($error == UPLOAD_ERR_OK) {
        $tmp_name = $_FILES["pictures"]["tmp_name"][$key];
        $name = $_FILES["pictures"]["name"][$key];
        move_uploaded_file($tmp_name, "$uploads_dir/$name");
    }
}
?>
```

move_uploaded_file

http://php.net/manual/en/function.move-uploaded-file.php

Security tips you must know before use this function

(1) make sure that the file is not empty.

(2) make sure the file name in English characters, numbers and (_-.) symbols, For more protection.

(3) make sure that the file name not bigger than 250 characters.

(4) Check File extensions and Mime Types that you want to allow in your project. You can use : pathinfo()

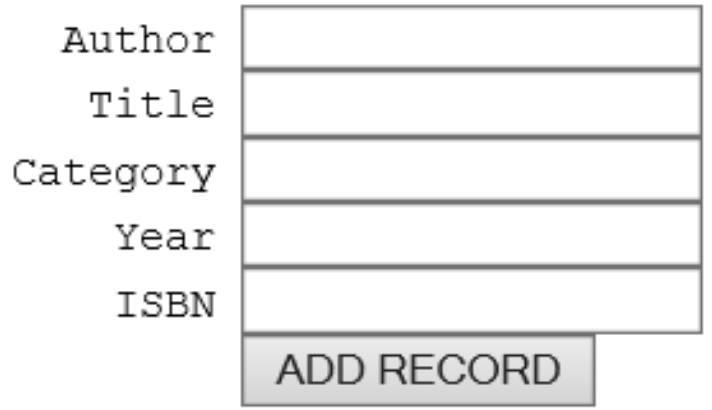

http://php.net/pathinfo

(5) Check file size and make sure the limit of php.ini to upload files is what you want, You can start from http://www.php.net/manual/en/ini.core.php#ini.file-uploads

(6) Check the file content if have a bad codes or something like this function http://php.net/manual/en/function.file-get-contents.php.

(7) You can use .htaccess to stop working some scripts as in example php file in your upload path.

WWW13 example

- Userid and password – authentication process

www13 => setupusers.php (to run)

- To create table users
- And two entries

  userid & password

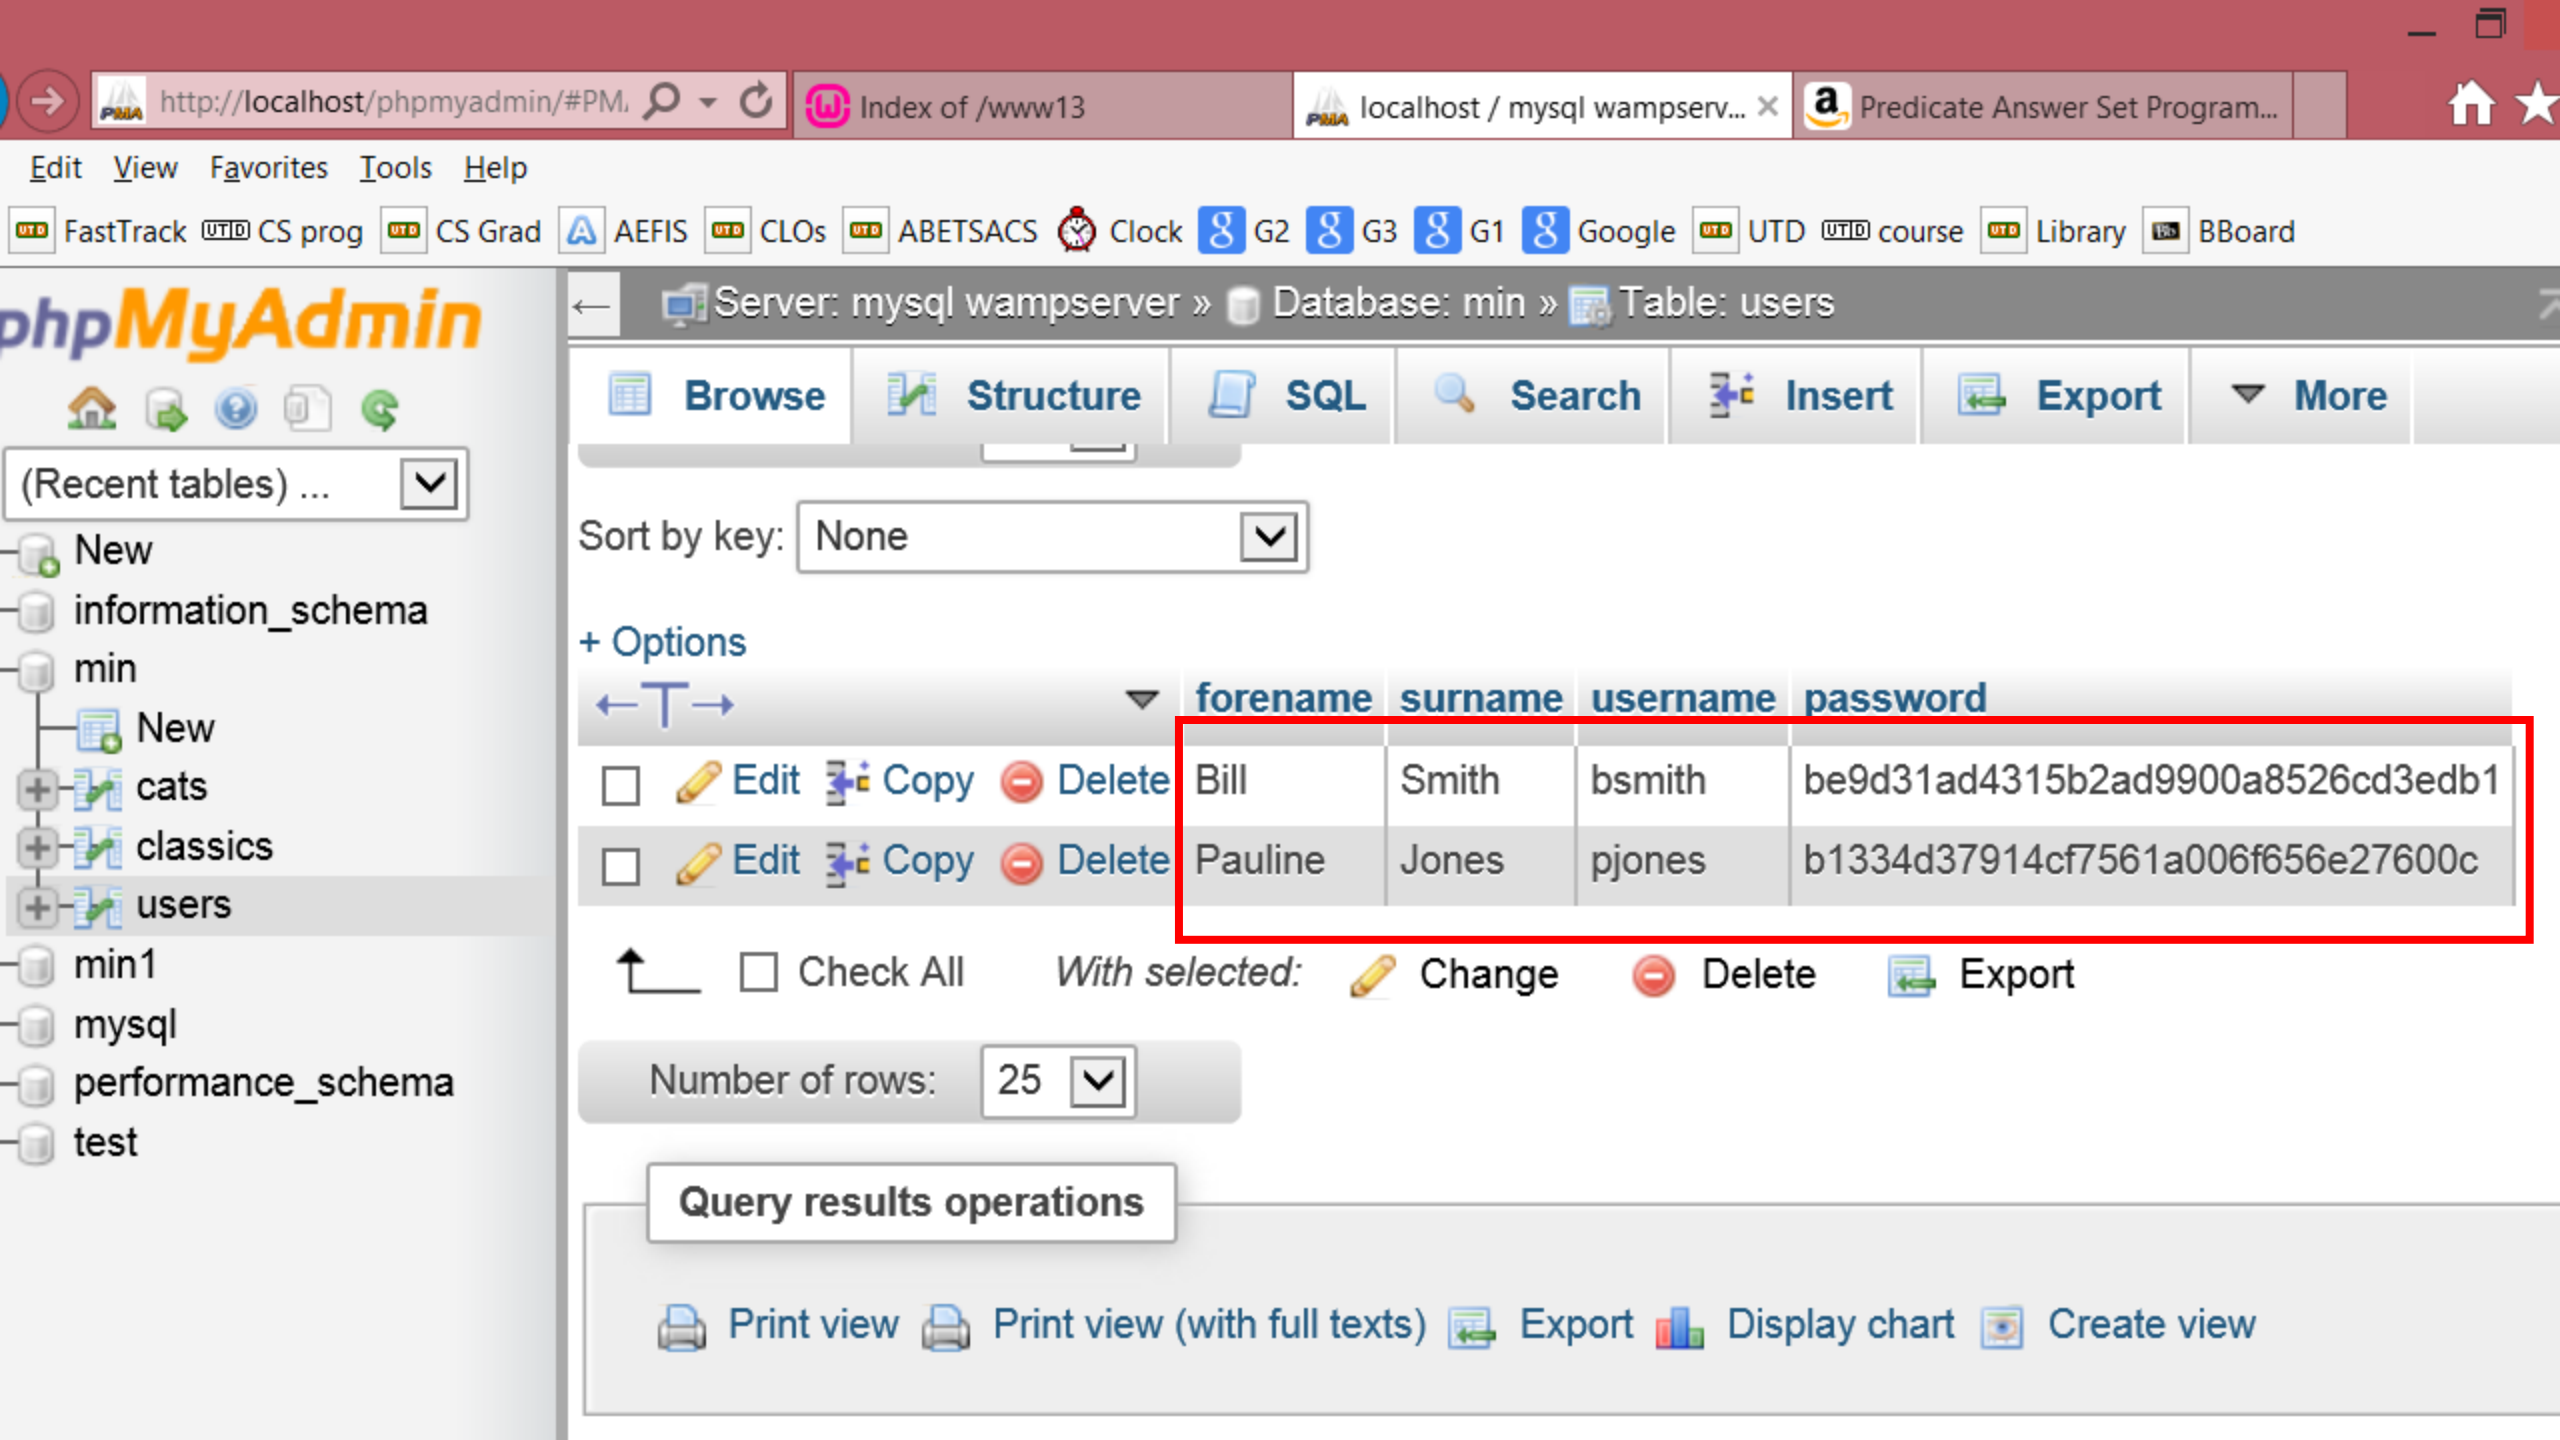

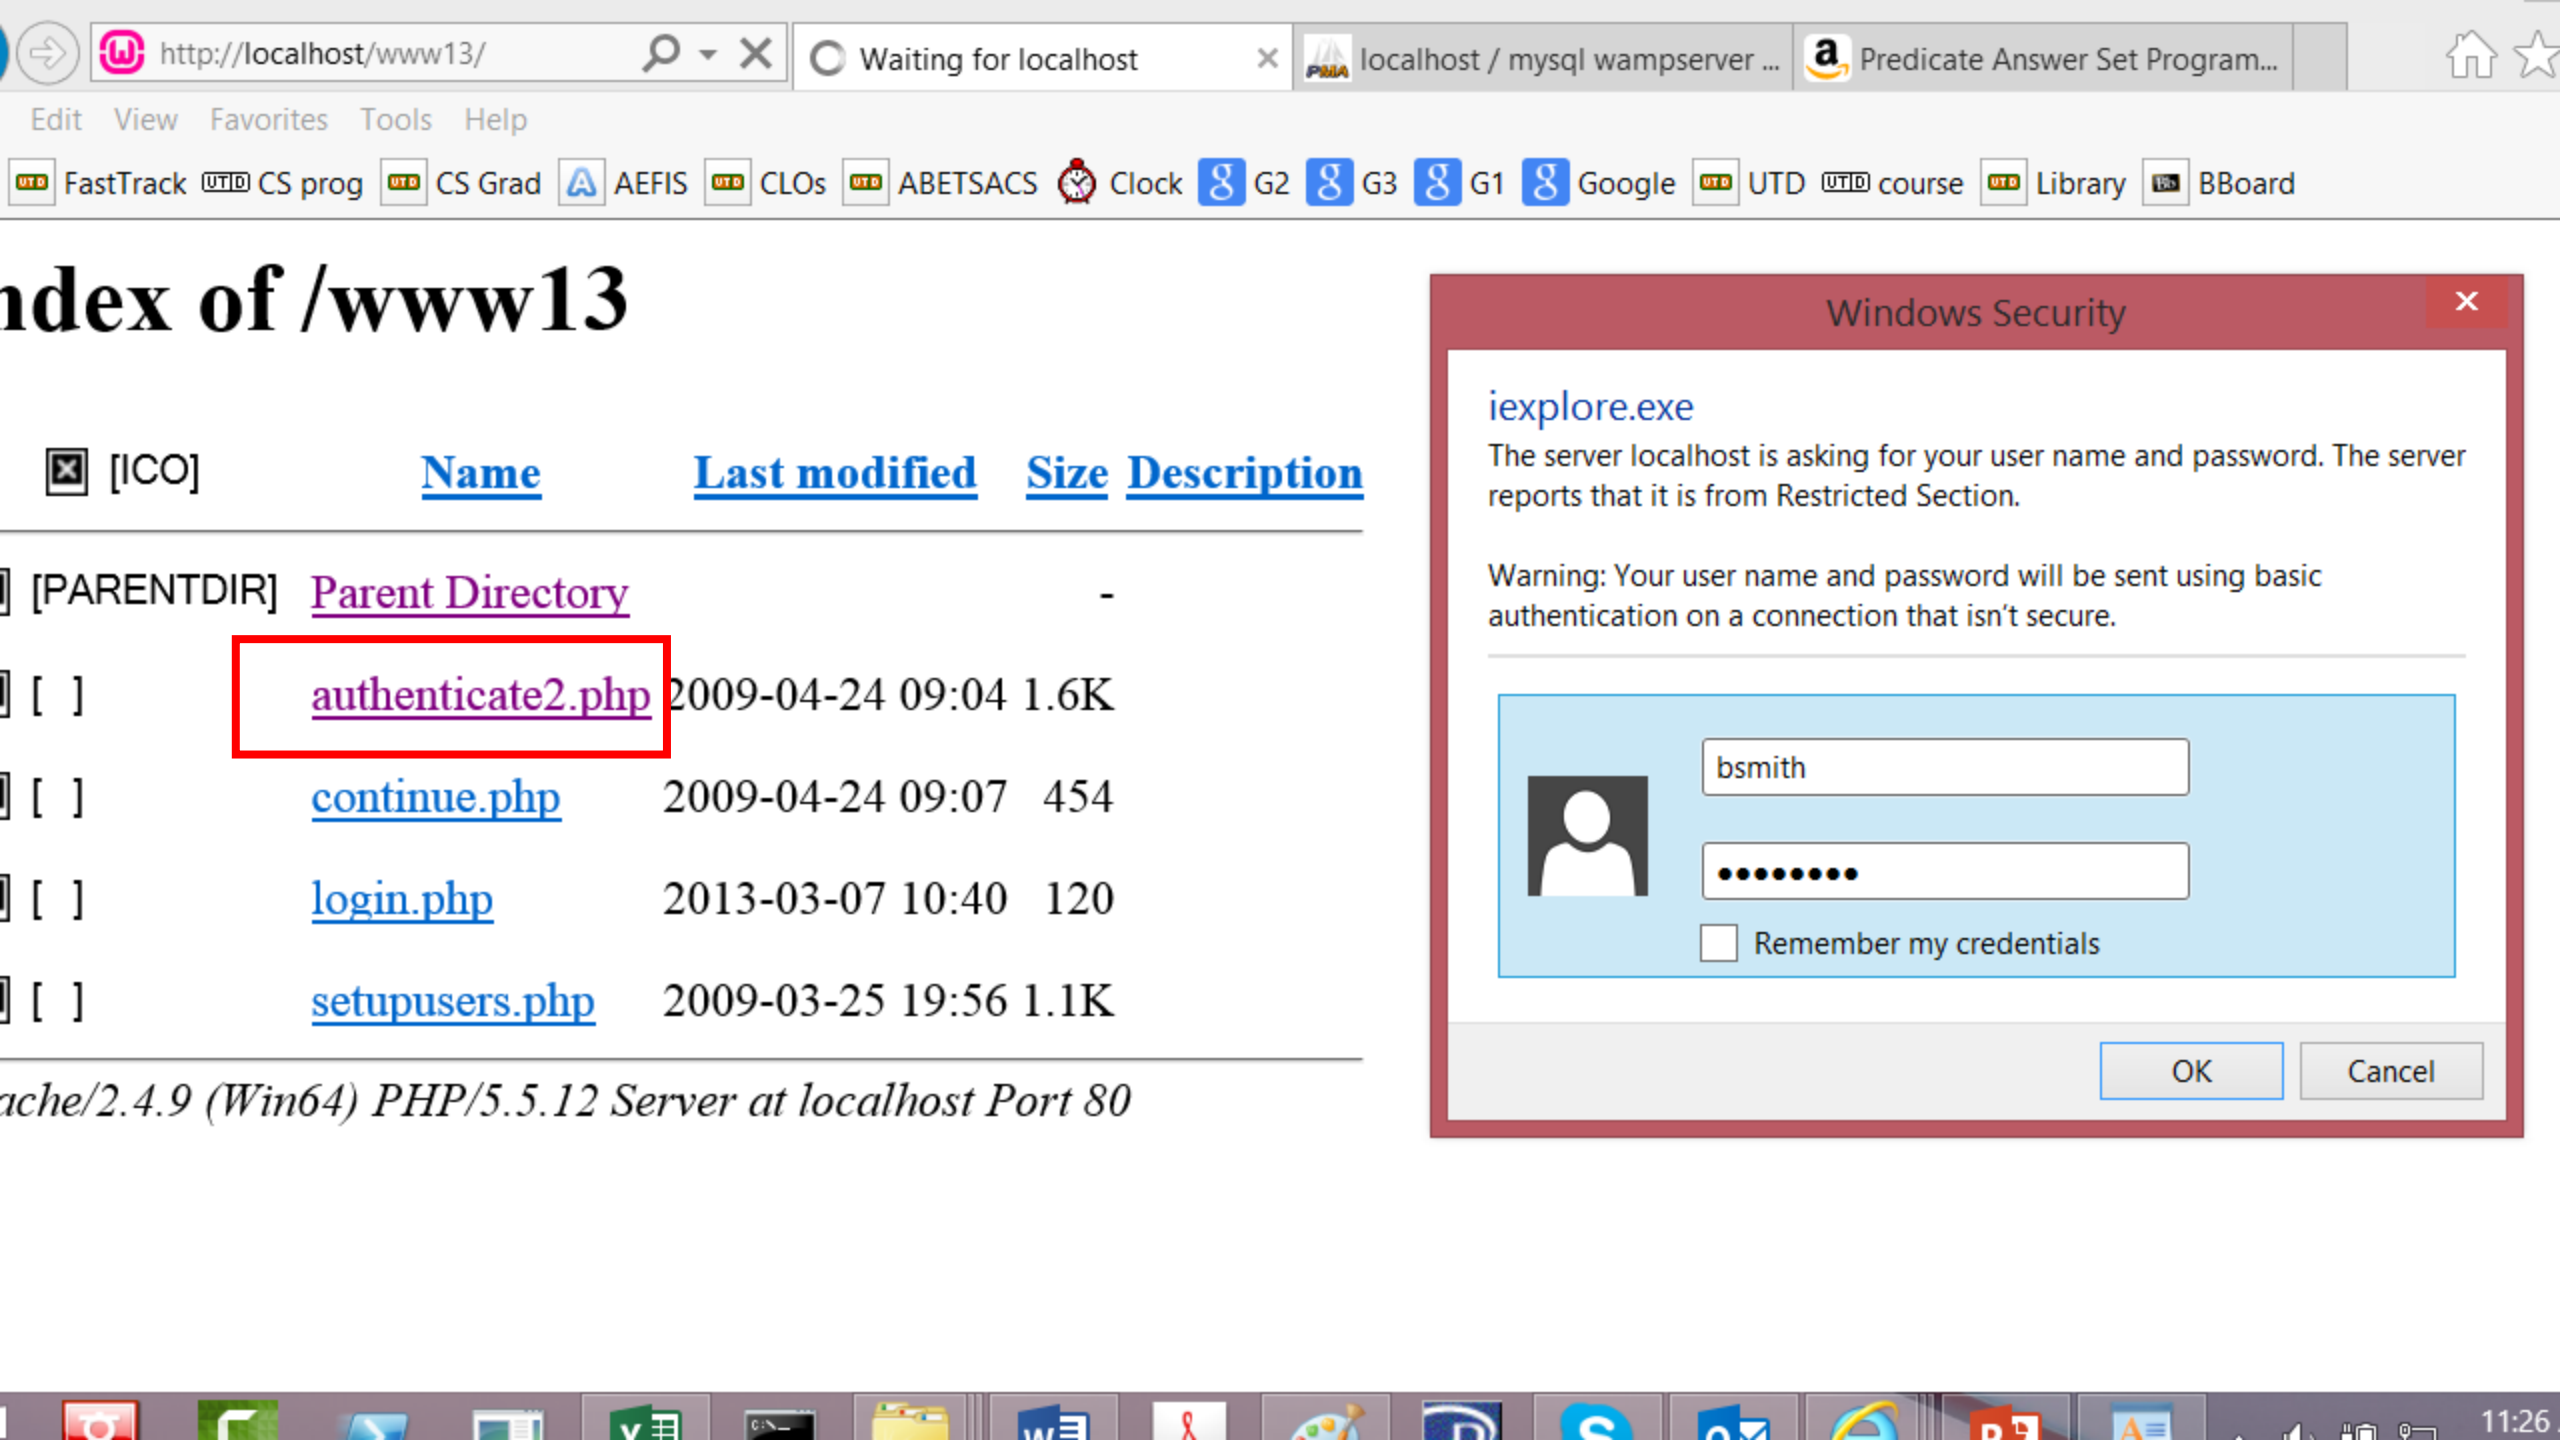

Two userids

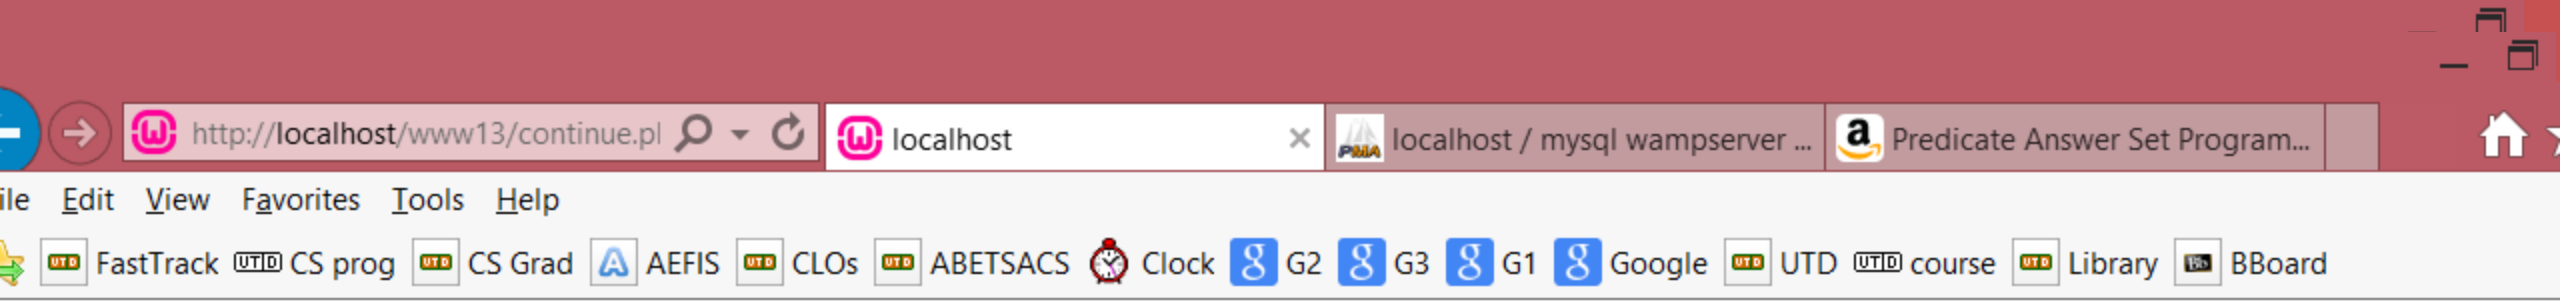

```
$username = 'bsmith';
$password = 'mysecret';

$username = 'pjones';
$password = 'acrobat';
```
